

VASA Final Meeting Report

WG3: Nature Conservation

Peyresq 13/09/2007

Audrey, Björn, Franz, Jan, Jana, Liba (+1), Martin & Nining

Outline

- Introduction
- Methods
- Results
- Conclusion

Introduction

Trends in nature conservation - how to conserve what for whom?

reduce vulnerability

for who?

Develop adaptation strategy

for what?

... and how?

Method: From drivers & pressures to impacts and vulnerability

Stakeholders, literature,
fieldtrips & personal expertise

Regional drivers
& pressures

4 * Global MA

Identification of local drivers

Example [Policy & Administration], how one main driver was assessed

	OS		TG		GO		AM	
Policy and Administration	R	T	R	T	R	T	R	T
Subsidies	1	↑	2	↓	1	↑	1	↑
Spatial planning	1	↑	1	↑	2	↑↓	1	↑
Legislation	1	↑	2	→	1/2	↑↓	1	↑

Legend for R (Relevance)

1 = high relevance for given scenario

2 = low relevance for given scenario

Legend for T (Tendencies)

↑ = significant increase of the driver in given scenario

→ = no significant trend of the driver in given scenario

↓ = significant decrease of the driver in given scenario

Identification of local drivers

Example [Policy & Administration], how one main driver was assessed

	OS		TG		GO		AM	
Policy and Administration	R	T	R	T	R	T	R	T
Subsidies	1	↑	2	↓	1	↑	1	↑
Spatial planning	1	↑	1	↑	2	↑↓	1	↑
Legislation	1	↑	2	→	1/2	↑↓	1	↑

Legend for R (Relevance)

1 = high relevance for given scenario

2 = low relevance for given scenario

Legend for T (Tendencies)

↑ = significant increase of the driver in given scenario

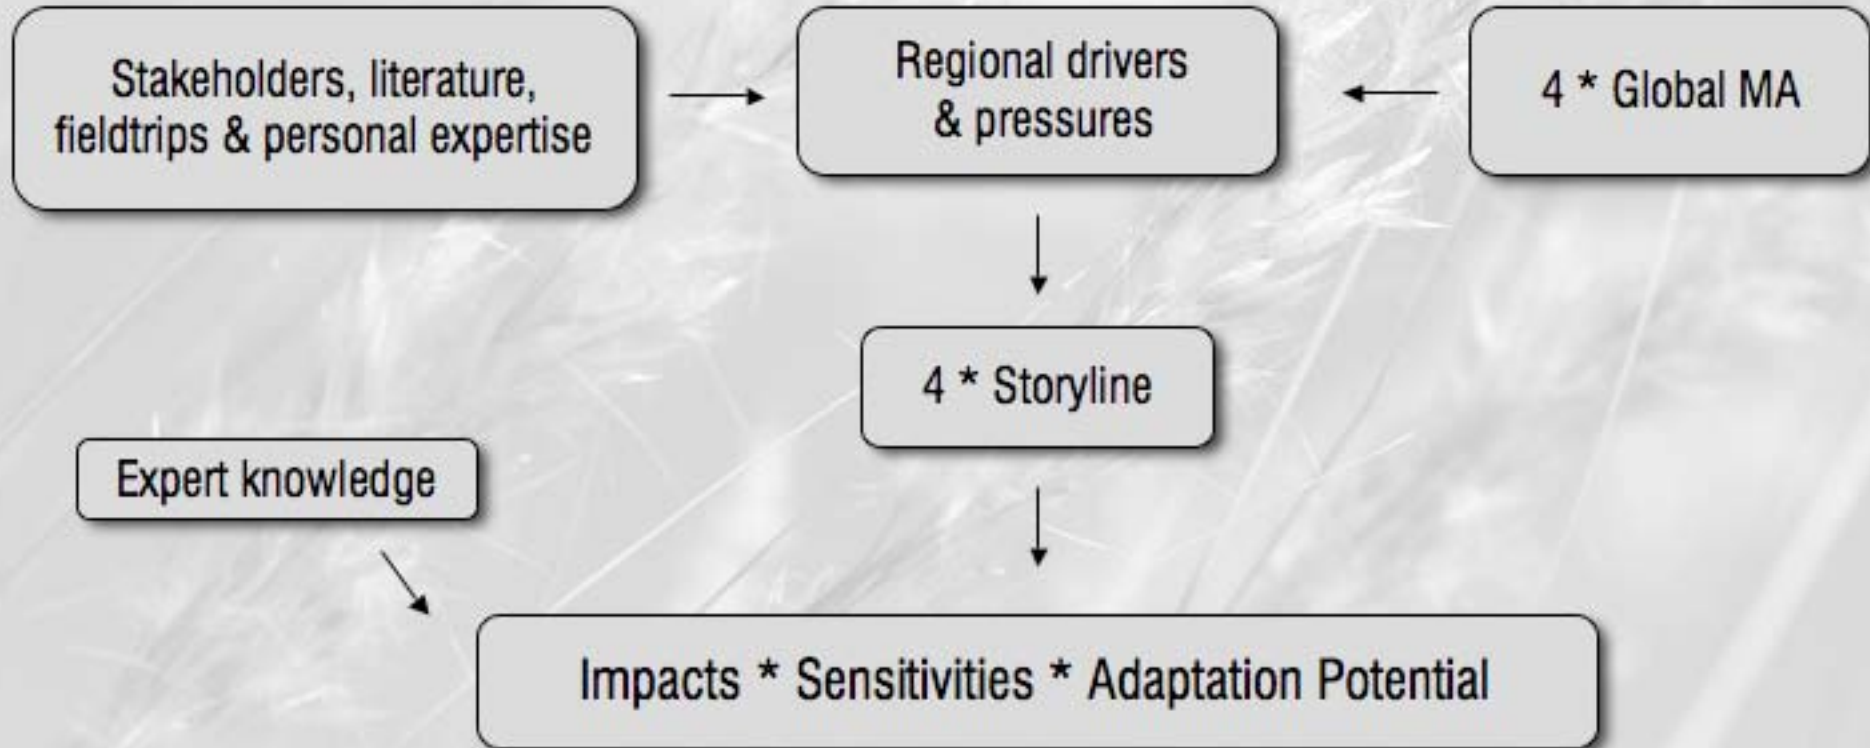

→ = no significant trend of the driver in given scenario

↓ = significant decrease of the driver in given scenario

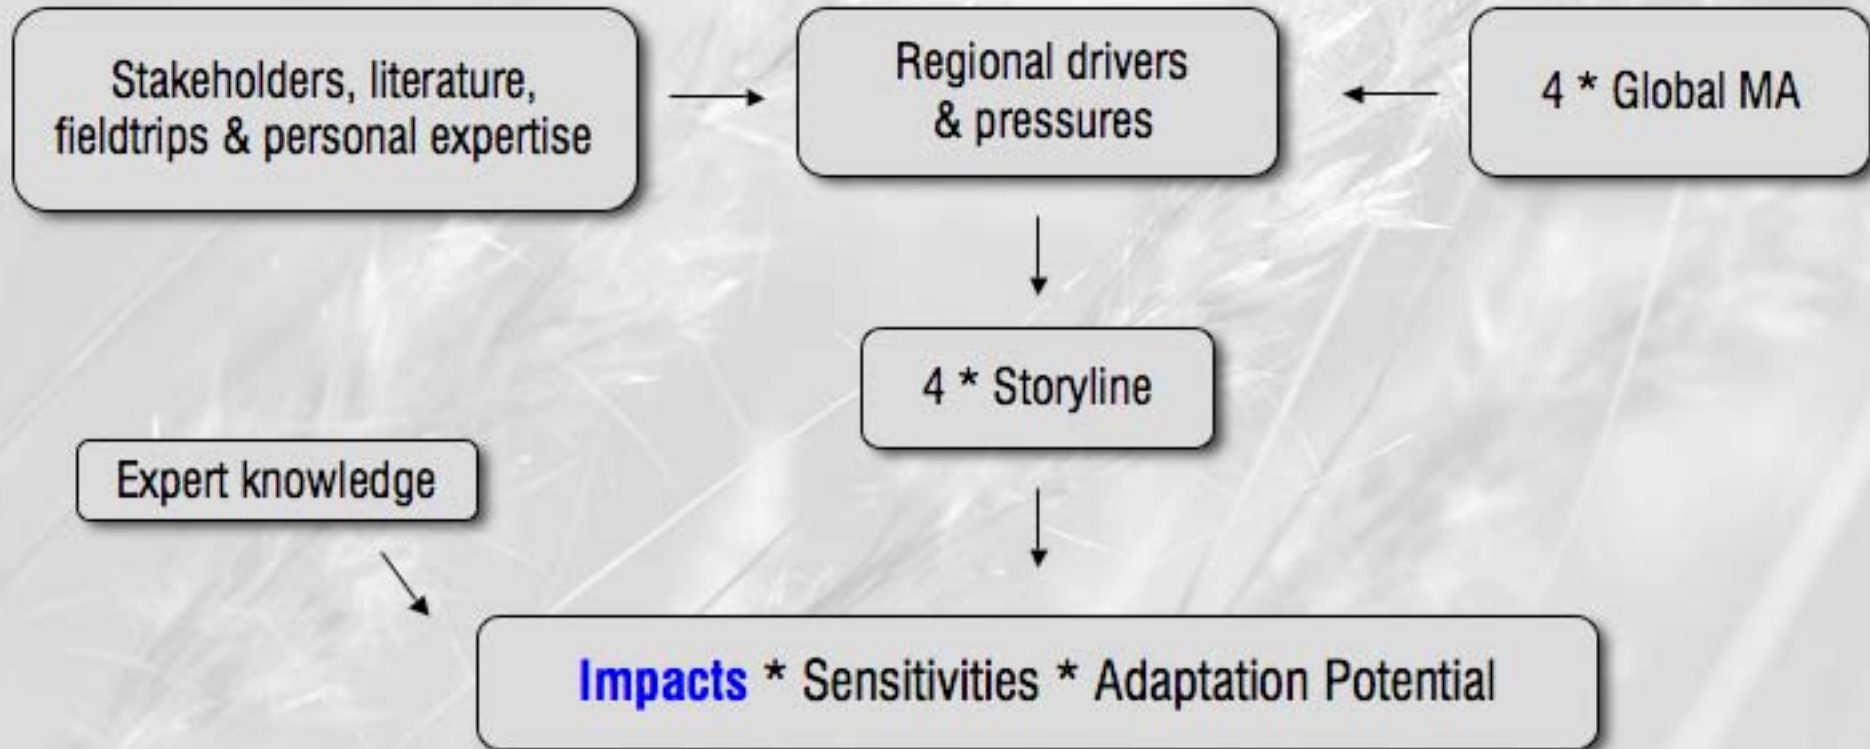

Method: From drivers & pressures to impacts and vulnerability

Method: From drivers & pressures to impacts and vulnerability

Method: From drivers & pressures to impacts and vulnerability

Impacts on ecosystem services

Example: how impacts are assessed, overall 16 different impacts are identified

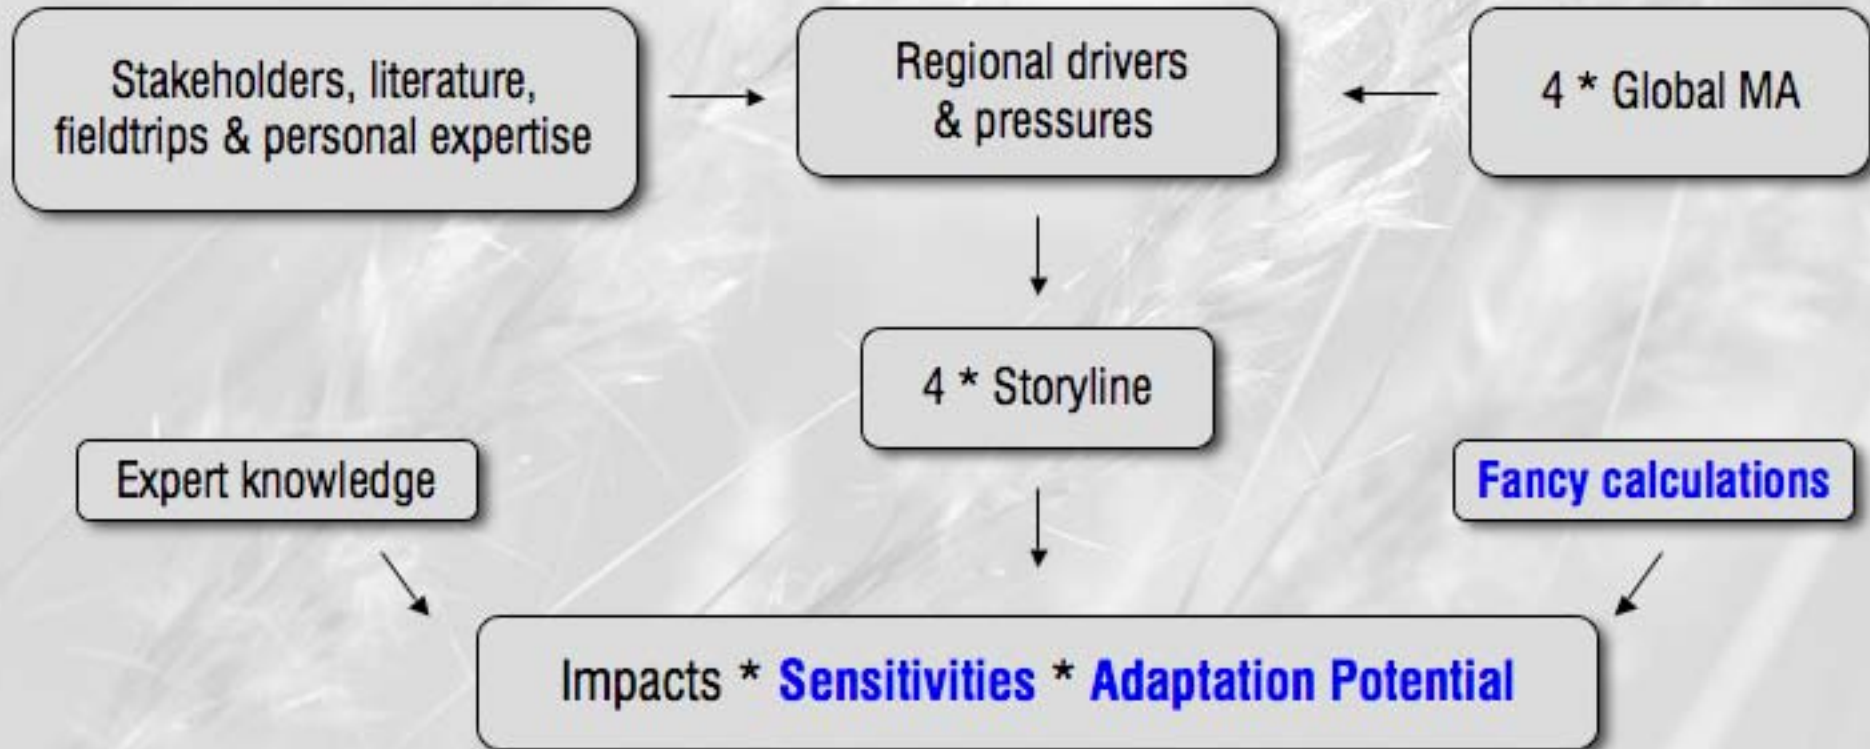

Impacts on ecosystem services

Example: how impacts are assessed, overall 16 different impacts are identified

Method: From drivers & pressures to impacts and vulnerability

Method to assess sensitivities and adaptation potential

RISK

		Impact			
		0	+	++	+++
Sensitivity	0	no	no	no	no
	+	no	low	low	medium
	++	no	low	medium	high
	+++	no	medium	high	high

VULNERABILITY

		Adaptation potential		
		+	++	+++
Risk	no	no	no	no
	low	medium	low	very low
	medium	high	medium	low
	high	very high	high	medium

Assessment of the vulnerability

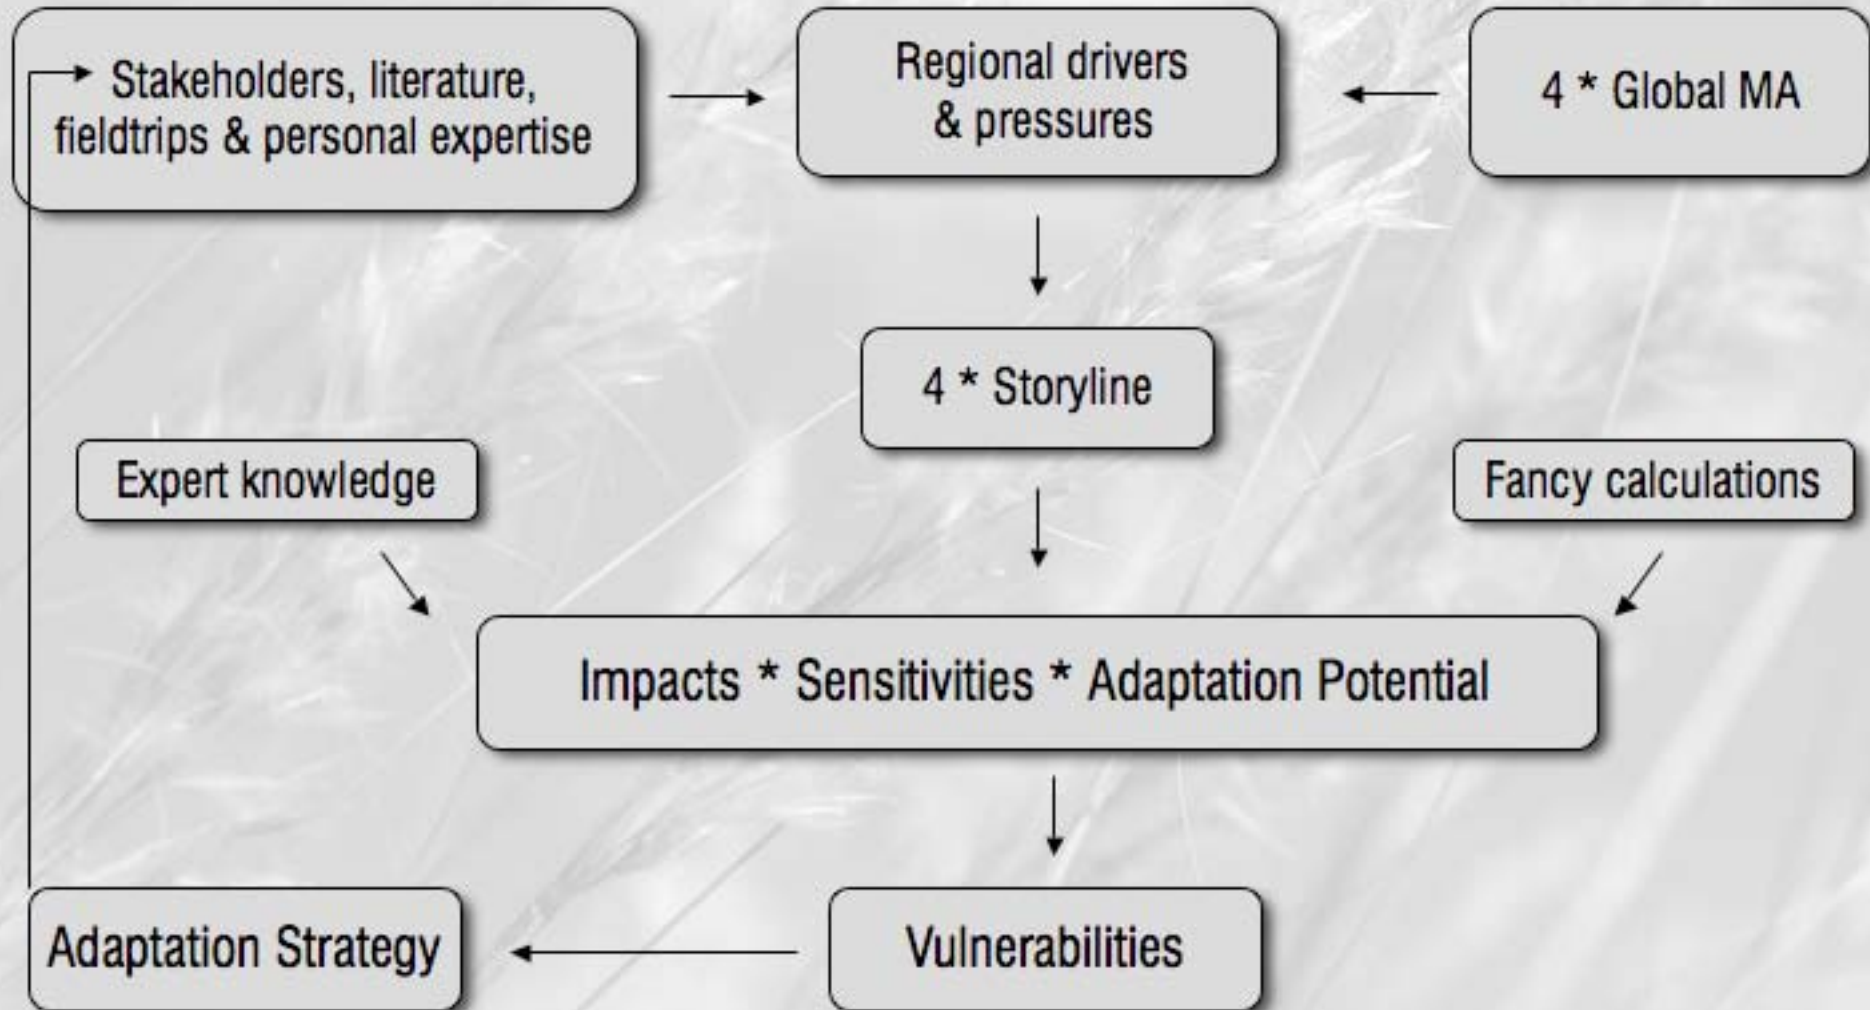

Example: Resulting vulnerabilities of each stakeholder to changes in different ecosystem services, Global Orchestration

Impact on ecosystem service

	forestry		agriculture		tourism		nature	
	2020	2050	2020	2050	2020	2050	2020	2050
Forest degradation and frequency of forest fires	high	high	very low	medium	medium	high	high	high
loss in productivity of forests	high	high	very low	medium	not vulnerable	not vulnerable	very low	medium
loss and degradation of open landscape (pastures & meadows)	very low	medium	high	high	high	high	high	high

Method: From drivers & pressures to impacts and vulnerability

Adaptation strategies

Example: Adaptation strategies for the forest sector under Global Orchestration

Impact on ecosystem service	Management activity	Stakeholder	Urgency
Forest degradation and frequency of forest fires	strengthening of fire fighter system	local authorities, inhabitants, forestry	HIGH
	forest management which aims to reduce fire risks (eg. removal of deadwood, fire resistant species)	forestry, inhabitants	HIGH
Loss in productivity of forests	planting of warm-climate, drought and fire-adapted tree species	forestry, inhabitants	MEDIUM

Main results: Adaption strategy

Impact on ecosystem service	stakeholder	VULNERABILITY				Adaption measure
		GO 2050	OFS 2050	AM 2050	TG 2050	
Forest degradation and frequency of forest fires	forestry, inhabitants	medium	medium	high	medium	reduce fire risks (eg. efficient fire fighter system, removal of deadwood, fire resistant species)
loss and degradation of open landscape (pastures & meadows)	local authorities, agriculture	medium	high	low	low	promote locally grown high-quality food (eg. tourism sector)
degradation of rivers and wetlands	local authorities, agriculture	high	low	low	low	conserve floodplain areas and remaining wetlands
degradation of protected areas	agriculture, nature conservation, forestry	low	low	low	low	implement nature conservation sites properly, use different conservation strategies
loss of alpine area	agriculture, nature conservation	medium	medium	low	high	give incentives for high-altitude sheepherding

Main results: Temporal changes

Impact on ecosystem service	VULNERABILITY								Adaption measure
	forestry		agriculture		tourism		nature cons.		
	2020	2050	2020	2050	2020	2050	2020	2050	
Forest degradation and frequency of forest fires	Green	Red	Green	Yellow	Green	Yellow	Green	Red	reduce fire risks (eg. efficient fire fighter system, removal of deadwood, fire resistant species)
loss and degradation of open landscape (pastures & meadows)	Yellow	Yellow	Orange	Orange	Orange	Orange	Orange	Orange	promote locally grown high-quality food (eg. tourism sector)
degradation of rivers and wetlands	Orange	Orange	Yellow	Yellow	Orange	Orange	Yellow	Yellow	conserve floodplain areas and remaining wetlands
degradation of protected areas	Green	Orange	Green	Orange	Green	Yellow	Green	Yellow	implement nature conservation sites properly, use different conservation strategies
loss of alpine area	Yellow	Yellow	Orange	Red	Orange	Red	Orange	Red	give incentives for high-altitude sheepherding

Conclusion

Strong impacts on ecosystems in all four scenarios

- Main drivers: Climate change and related effects (Fire!)
- Land use change: abandonment & loss of open landscape

BUT

- proactive scenarios reduce risks significantly
 - regionalized scenarios reduce risks from land use change
- ➔ implement proactive management!**
- ➔ local decisions make a difference!**

Thank you!
