-> Earth's Climate Zones (rough picture)

The Ocean Land Exchange in the Climate System

Caution:

Zonal weather pattern is not completely true.
The pattern is disrupted by land-sea contrasts

Land heats and cools rapidly

Water heats and cools slowly

2/3 of Earth's surface is covered by Oceans

5. Wind Effects on Oceans

Coupling between Wind and Ocean Flow (B)

Consequences of upwelling

- Deep water is rich in nutrients (P, N, Fe)
- Upwelling brings nutrient-rich water to the surface ocean, fueling biological productivity (**phytoplankton**)
- **Zooplankton** eat the phytoplankton
- **Fish** eat both of these -> good fisheries in upwelling zones

Winds also cause large gyres (circular patterns)
in the surface ocean...

6. Energy Transport by Conveyer Belt in the Oceans

*Atlantic meridional overturning circulation (AMOC)

(Rahmstorf, Nature 2002)

- Surface
- Deep
- Bottom
- Salinity > 36 ‰
- Salinity < 34 ‰
- Deep Water Formation

Atlantic meridional overturning circulation (AMOC)

- The Atlantic meridional overturning circulation (AMOC) is the zonally integrated component of surface and deep currents in the Atlantic Ocean.
- It is characterized by a northward flow of warm, salty water in the upper layers of the Atlantic, and a southward flow of colder, deep waters that are part of the thermohaline circulation.
- The AMOC is an important component of the Earth's climate system, and is a result of both atmospheric and thermohaline drivers.

Result: Energy Transport in the Earth System

Solar energy received is greatest near the equator.

Energy is moved from the equator to the poles.

**Energy is transferred by
wind and ocean currents**
