

# Organizing the science-policy interface in strategic policy planning

Prof. Dr. Christian Flachsland

PEP 1.5 Final Symposium -  
Archetypes of decarbonization pathways and  
climate policy entry points to raise ambition

PIK, 4 September 2019

# Practical considerations on the science-policy interface

# Strategic climate policy planning

- National institutions for strategic climate policy planning seem underdeveloped
- In Germany, governance of climate policy planning:
  - Sector GHG targets
  - Iterative internal review of ministry proposals for sector policies
  - Adjustment of policy packages
  - Sectoral policy commissions (coal exit, transport sector, buildings fails)
  - Climate cabinet led by Chancellor: Finally, some high-level policy coordination
- Problems:
  - High system complexity difficult to process for ministries, parliamentarians
  - Little transparency
  - Expertise provided by consulting companies
  - Policy integration and effectiveness remains questionable

# Scientific policy advice as a smoothie machine?

Formal  
legislation

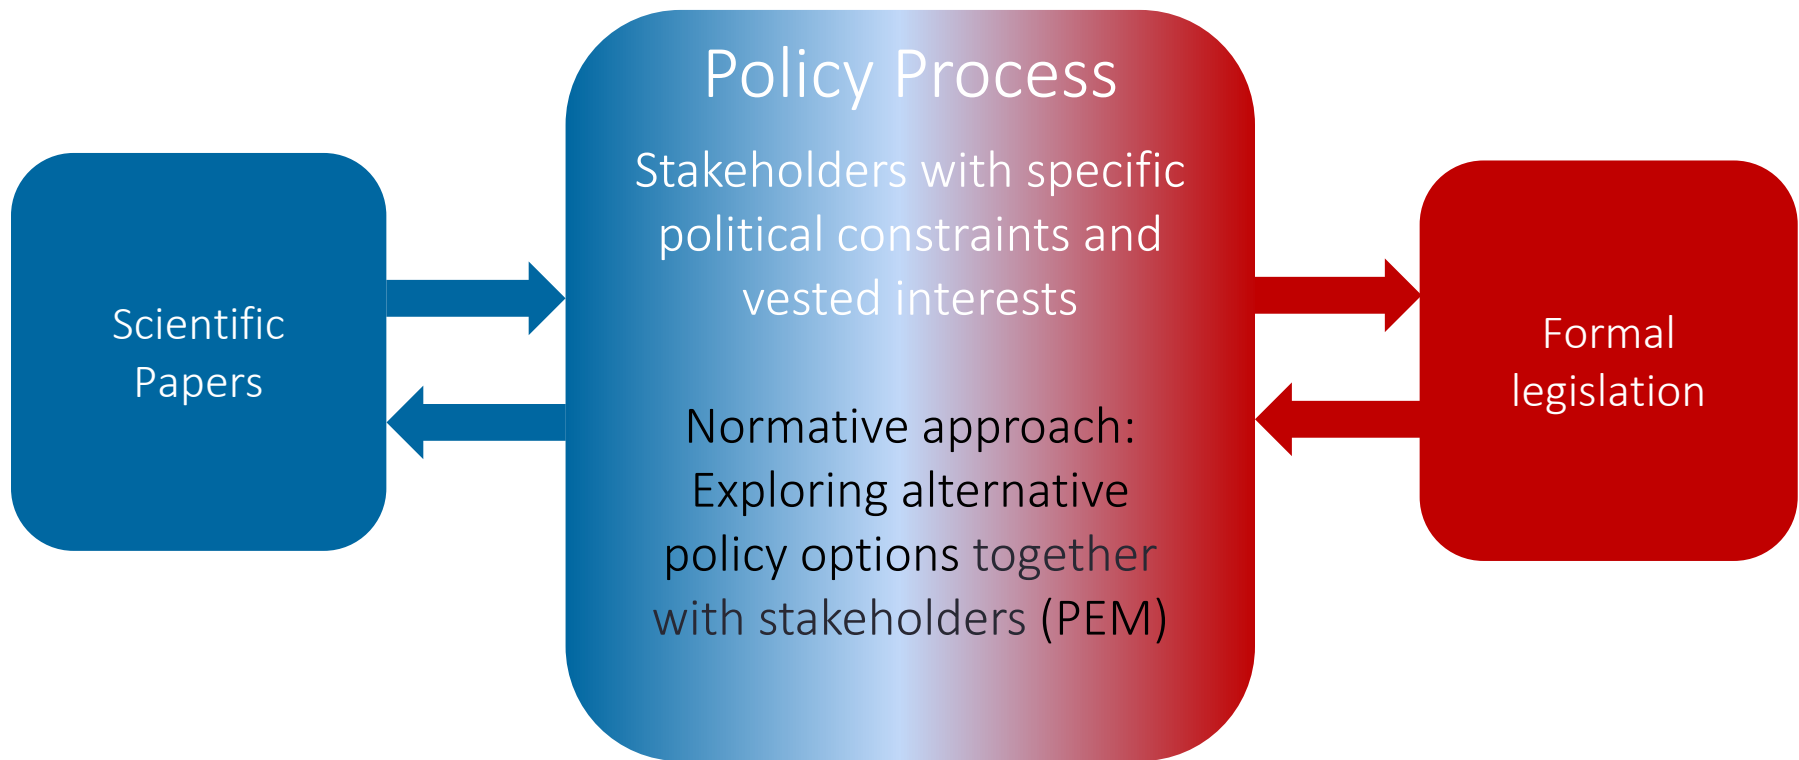

# The role of science in the policy process

- Speaking truth to power: Linear model does not work, because it neglects political dynamics as well as value judgments and uncertainty in science

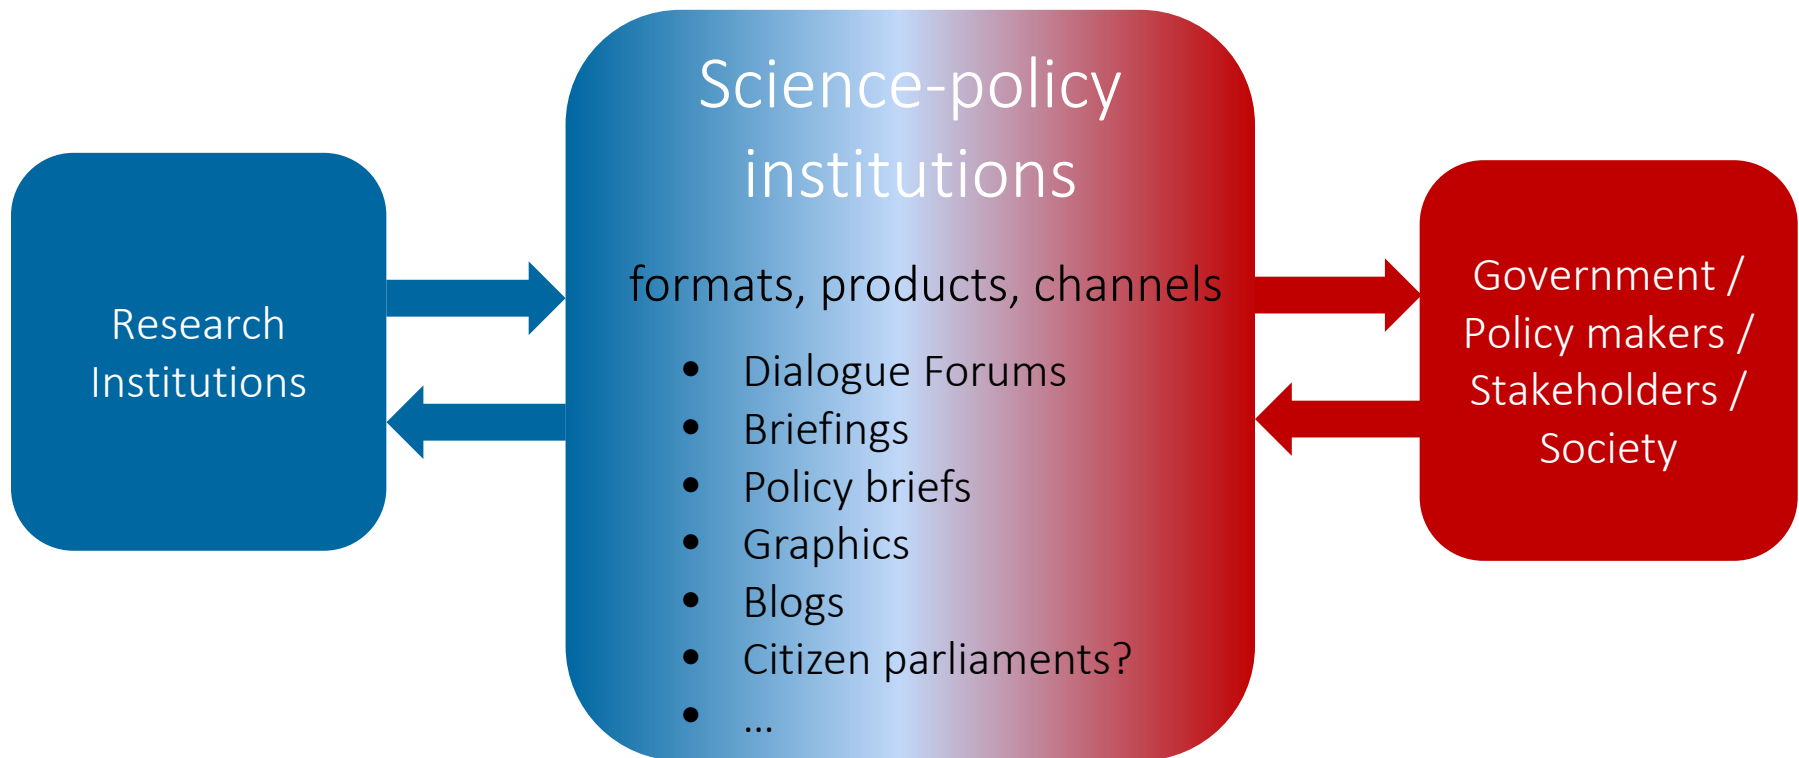

# The role of science in the policy process

- Better approach: science has to acknowledge the policy process and be actively engaged in it without mixing roles.

# The role of science in the policy process

- Innovative formats can structure the process and increase the impact on political discourses.
- Particular products and channels can enhance communication

# Elements for the science-policy interface recipe

- 1) **Appreciate decision-problem:** Seriously aim to understand constraints of policymakers & stakeholders (what do they **want to know**)?
  - Dialogue fora, formal and informal conversations
- 2) **Active agenda-setting:** Advocate putting policy items on the agenda, advance peer-review research to clarify the issues (what decision-makers **should know**)
  - Peer-reviewed papers, newspaper op-eds, interviews, talks, etc.
- 3) **Applied policy analysis:** With agenda set, analyze alternative policy options in detail – using multiple suitable methods
  - Policy reports, ministerial peer-review, workshops, network
- 4) **Build unusual alliances and get out of comfort zone**
  - e.g. working with conservative economists, parties, industry
- 5) **Build stakeholder trust** and advance mutual learning over time
  - e.g. policy dialogue fora
- 6) **Build institutions** enabling all of this
